Overall Image of the NCXX Group

IoT Solutions

The Internet of Things (IoT) refers to a system that automates various controls by enabling “things” such as sensors and devices connected through the Internet to exchange data with each other. By equipping each of these devices with a wireless communication function, we propose a variety of solutions that realize greater operational efficiency.

System Solutions

We provide integrated one-stop services in the manufacturing, finance, distribution, and corporate and public sectors. Services cover all aspects from commercialization using blockchain technology and consulting to system development businesses, including design, construction, operation, and maintenance, as well as infrastructure construction such as networks and databases.

Internet Travel

For customers who wish to take a one-of-a-kind trip, not being satisfied with regular travel tours and wanting to make trips that do not appear in guidebooks, our travel consultants, known as travel concierges, propose individually customized trips.

Brand Retail Platform Business

The brand retail platform business handles brand licenses (trademark rights) and retail businesses that sell miscellaneous goods and apparel. This business provides a service that can recommend items tailored to consumers’ tastes as well as being used in product development by converting information such as sales and web data into big data, and combining it with AI.

Total Nursing Care Business Support Service

We will solve various problems faced by nursing care providers, including through the provision of Care Online, a business support system for nursing care providers, and the proposal, development and sales of nursing care robots and nursing care ICT systems.

Robot Business

We aim to provide new value in a variety of fields, including nursing care, by combining robot and communication technologies and creating a new kind of robot, in the broad sense of the word, that is connected to a network, rather than the narrow sense of “robot” meaning an independent device (equipment) operated autonomously.

Agricultural ICT Business

We aim to realize an agricultural business in which anyone can succeed by selling safe, secure and delicious healthy vegetables grown through digitally managed soil chemistry, and by providing cultivation technologies for producers.
